

APPENDIX Q

Appendix Q of SAP is the route through which information, including, but not limited to product performance data, is made available to energy performance assessors that was not available when SAP was published. It is also the means by which test and calculation methodologies can be agreed that can be used to measure product performance and how that performance can be treated in SAP.

In simple terms, if an item is Appendix Q eligible, it means that it has been tested by BRE and the performance test results can be used in SAP calculations taking the place of default values included in the SAP calculation software. You will get a better SAP result if an Appendix Q eligible product is used.

Products currently included in the Appendix Q database are as follows:

1. Dynamic Insulation
2. Flue Gas Heat Recovery Systems
3. Heat Pumps
4. Hot Water Only Boilers
5. Ventilation (currently the largest database of manufacturers and products)
6. Waste Water Heat Recovery Systems
